AB The invention relates to a solid-phase method for preparing C-terminally  
 labeled peptides and building blocks to be used in this synthesis. The  
 building blocks have formula A-N(Lm-B)Kn-C, where A is a functionality for the  
 attachment to a solid support or a functionality already comprising a solid  
 support, B is a functionality for the attachment of one or more amino acids or  
 peptides or a functionality already comprising one or more amino acids or  
 peptides, C is a functionality for the attachment of one or more labels or a  
 functionality already comprising one or more labels, K, L are independently  
 (un)substituted alkyl chains with at least two C-atoms (one or more non-  
 neighboring C-atoms may be substituted by O, NH, alkyl- or arylimino, S, CO,  
 an ester or amide group and/or neighboring C-atoms may be connected via a  
 double or triple bond), and m, n are 0 or 1 with  $m + n \geq 1$ . Thus, N-biotinyl-  
 N'-Fmoc-ethylenediamine-MPB-AM-resin [MPB = [4-(3-carboxypropoxy)-2-  
 methoxyphenyl]methyl; Fmoc = fluorenylmethoxycarbonyl] was prepared and  
 applied to the synthesis of H-Asp-Glu-Val-Asp-Ala-Arg-NHCH<sub>2</sub>CH<sub>2</sub>NH-biotinyl.

AB We have developed a high throughput assay for the measurement of protease activity in solution. This technol. will accelerate research in functional proteomics and enable biologists to streamline protease substrate evaluation and optimization. The peptide sequences that serve as protease substrates in this assay are labeled on the carboxy terminus with a biotin moiety and a fluorescent tag is attached to the amino terminus. Protease cleavage causes the biotin containing fragment to be detached from the labeled peptide fragment. Following the protease treatment, all biotin containing species (uncleaved substrates and the cleaved carboxy-terminal fragment of the substrate) are removed by incubation with streptavidin beads. The cleaved fluorescently labeled amino-terminal part of the substrate remains in solution. The measured fluorescence intensity of the solution is directly proportional to the activity of the protease. This assay was validated using trypsin,

NOT PRIOR ART

chymotrypsin, caspase-3, subtilisin-A, enterokinase and tobacco etch virus protease.

AB Two novel peptide scaffolds, viz. cyclo[(N $\alpha$ -Alloc)Dpr-  $\beta$ -Ala-(N $\alpha$ -Fmoc)Dpr- $\beta$ -Ala] and cyclo[(N $\alpha$ -Alloc)Dpr-  $\alpha$ -azido- $\beta$ -aminopropanoyl-(N $\alpha$ -Fmoc)Dpr- $\beta$ -Ala], composed of orthogonally protected 2,3-diaminopropanoyl (Dpr) and  $\beta$ -alanyl residues, have been described. Fmoc chemical on a backbone amide linker derivatized resin has been used for the chain assembly. Selective removal of the 4-methyltrityl (Mtt) and 1-methyl-1-phenylethyl protections (PhiPr) exposes the  $\beta$ -amino and carboxyl terminus, resp., and on-resin cyclization then gives the desired orthogonally protected cyclo- $\beta$ -tetrapeptides. The  $\alpha$ -amino groups, bearing the Fmoc and Alloc protections and the azide mask, allow stepwise orthogonal derivatization of these solid-supported cyclo- $\beta$ -tetrapeptide cores. This has been demonstrated by attachments of various sugar units [viz., acetyl- or toluoyl-protected carboxymethyl  $\alpha$ -D-glycopyranosides and Me 6-O-(4-nitrophenoxy carbonyl)- $\alpha$ -D-glycopyranosides] to obtain diverse di- and trivalent glycoclusters. Acidolytic release (TFA) from the support, followed by conventional NaOMe-catalyzed transesterification or hydrazine-induced acyl substitution in DMF (41 and 42), gives the fully deprotected clusters as final products.

AB The invention relates to a solid-phase method for preparing C-terminally labeled peptides and building blocks to be used in this synthesis. The building blocks have formula A-N(Lm-B)Kn-C, where A is a functionality for the attachment to a solid support or a functionality already comprising a solid support, B is a functionality for the attachment of one or more amino acids or peptides or a functionality already comprising one or more amino acids or

peptides, C is a functionality for the attachment of one or more labels or a functionality already comprising one or more labels, K, L are independently (un)substituted alkyl chains with at least two C-atoms (one or more non-neighboring C-atoms may be substituted by O, NH, alkyl- or arylimino, S, CO, an ester or amide group and/or neighboring C-atoms may be connected via a double or triple bond), and m, n are 0 or 1 with  $m + n \geq 1$ . Thus, N-biotinyl-N'-Fmoc-ethylenediamine-MPB-AM-resin [MPB = [4-(3-carboxypropoxy)-2-methoxyphenyl]methyl; Fmoc = fluorenylmethoxycarbonyl] was prepared and applied to the synthesis of H-Asp-Glu-Val-Asp-Ala-Arg-NHCH<sub>2</sub>CH<sub>2</sub>NH-biotinyl.

 AB A novel linker strategy for the efficient synthesis of peptides C-terminally  
 labeled with the EDANS [EDANS = 1-Naphthalenesulfonic acid, 5-[(2-  
 aminoethyl)amino]-] fluorophore is described. Using this support, FRET  
 peptide substrates bearing EDANS/Dabcyl [Dabcyl = benzoic acid, 4-[[4-  
 (dimethylamino)phenyl]azo]-] fluorescent donor/acceptor groups can be readily  
 prepared using standard Fmoc (Fmoc = 9-fluorenylmethyloxycarbonyl) solid  
 phase methods.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Methods of preparing combinatorial libraries of mercapto (thiol) compounds and compositions obtained therefrom are disclosed. The compounds are synthesized on a solid support. Following synthesis, the compounds are optionally cleaved from the support. One such method of synthesis involves attack of an S-protected nucleophile on a resin functionalized with a leaving group. The invention also provides for screening the mercapto compounds for bioactive compounds; in particular, for inhibitors of MMPs.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A novel method for generating hydroxylamine, hydroxamic acid, hydroxyurea, and hydroxylsulfonamide compounds is disclosed. The method involves the nucleophilic attack of an alkoxyamine on a suitable solid phase support. Techniques of combinatorial chemistry can then be applied to the immobilized alkoxyamine to generate a diverse set of compounds. Cleavage of the compounds from the support yields a library of hydroxylamine or hydroxylamine derivative compounds, which can be screened for biological activity (e.g., inhibition of metalloproteinases).

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB    The invention relates to a solid-phase method for preparing C-terminally labeled peptides and building blocks to be used in this synthesis. The building blocks have formula A-N(Lm-B)Kn-C, where A is a functionality for the attachment to a solid support or a functionality already comprising a solid support, B is a functionality for the attachment of one or more amino acids or peptides or a functionality already comprising one or more amino acids or peptides, C is a functionality for the attachment of one or more labels or a functionality already comprising one or more labels, K, L are independently (un)substituted alkyl chains with at least two C-atoms (one or more non-

neighboring C-atoms may be substituted by O, NH, alkyl- or arylimino, S, CO, an ester or amide group and/or neighboring C-atoms may be connected via a double or triple bond), and m, n are 0 or 1 with  $m + n \geq 1$ . Thus, N-biotinyl-N'-Fmoc-ethylenediamine-MPB-AM-resin [MPB = [4-(3-carboxypropoxy)-2-methoxyphenyl]methyl; Fmoc = fluorenylmethoxycarbonyl] was prepared and applied to the synthesis of H-Asp-Glu-Val-Asp-Ala-Arg-NHCH<sub>2</sub>CH<sub>2</sub>NH-biotinyl.

AB Methods of preparing combinatorial libraries of mercapto (thiol) compounds them and compositions obtained therefrom are disclosed. The compounds are synthesized on a solid support. Following synthesis, the compounds are optionally cleaved from the support. One such method of synthesis involves attack of an S-protected nucleophile on a resin functionalized with a leaving group. The invention also provides for screening the mercapto compounds for bioactive compounds; in particular, for inhibitors of MMPs.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A novel method for generating hydroxylamine, hydroxamic acid, hydroxyurea, and hydroxylsulfonamide compounds is disclosed. The method involves the nucleophilic attack of an alkoxyamine on a suitable solid phase support. Techniques of combinatorial chemistry can then be applied to the immobilized alkoxyamine to generate a diverse set of compounds. Cleavage of the compounds from the support yields a library of hydroxylamine or hydroxylamine derivative compounds, which can be screened for biological activity (e.g., inhibition of metalloproteinases).

AB Difficulties encountered in the synthesis of resin-bound secondary amines attached via an acid-labile linker encouraged us to employ an alternative approach. A one-pot, scalable procedure for the synthesis of Fmoc-protected, amine/linker constructs is reported. These compds. can be efficiently coupled to a solid support and be used in the synthesis of carboxamides and sulfonamides. The advantages of the method are the elimination of problems associated with variability of alkoxybenzaldehyde resins, minimization of difficulties encountered in solid-phase reductive aminations, and a means for quantifying the resin loading of the secondary amine.

L24 ANSWER 5 OF 5 USPATFULL on STN

ACCESSION NUMBER: 2002:230828 USPATFULL Full-text  
TITLE: Methods for solid phase synthesis of mercapto compounds  
and derivatives, combinatorial libraries thereof and  
compositions obtained thereby  
INVENTOR(S): Patel, Dinesh V., Fremont, CA, United States  
Ngu, Khehyong, Lawrenceville, NJ, United States  
Zhou, Jianping, Mountain View, CA, United States  
PATENT ASSIGNEE(S): Versicor, Inc., Fremont, CA, United States (U.S.  
corporation)

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Methods of preparing combinatorial libraries of mercapto (thiol) compounds them and compositions obtained therefrom are disclosed. The compounds are synthesized on a solid support. Following synthesis, the compounds are optionally cleaved from the support. One such method of synthesis involves attack of an S-protected nucleophile on a resin functionalized with a leaving group. The invention also provides for screening the mercapto compounds for bioactive compounds; in particular, for inhibitors of MMPs.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

IT 454466-68-3DP, resin-bound 454466-68-3P  
 (solid phase synthesis of mercapto compds. and derivs. and combinatorial libraries)
